

SummarAI

Installation Guide

How to run SummarAI locally

NLP Group Project · 2025–2026

Requirements

- Python **3.10** or **3.11** (3.12+ not tested)
- **pip 23+**
- **ffmpeg** (any recent version) — required by Whisper for audio decoding
- **Anthropic API key** — needed for Claude summarisation
- At least **8 GB RAM** and **3 GB free disk space** for Whisper model weights

Compatible with macOS, Linux, and Windows (PowerShell).

Setup Steps

Step 1 — Clone the Repository

```
git clone https://github.com/tono2002/nlp-project.git
cd nlp-project
```

Step 2 — Create a Virtual Environment

```
python -m venv .venv
```

macOS / Linux:

```
source .venv/bin/activate
```

Windows (PowerShell):

```
.venv\Scripts\Activate.ps1
```

Step 3 — Install Python Dependencies

```
pip install --upgrade pip
pip install -r requirements.txt
```

Step 4 — Install ffmpeg

macOS:

```
brew install ffmpeg
```

Ubuntu / Debian:

```
sudo apt install ffmpeg
```

Windows — download from ffmpeg.org/download.html and add the bin/ folder to PATH.

Step 5 — Configure Environment Variables

Copy the example file and fill in your Anthropic API key:

```
cp .env.example .env
```

Open `.env` and set:

```
ANTHROPIC_API_KEY=sk-ant-...
```

Supabase variables (`SUPABASE_URL`, `SUPABASE_ANON_KEY`) are optional. Without them, project saving is disabled but summarisation still works.

Step 6 — Run the App

```
python -m uvicorn src.app:app --reload --port 8000
```

Open **`http://127.0.0.1:8000`** in your browser. On first run, Whisper will download the *base.en* model weights (~145 MB). This is cached for subsequent runs.

Step 7 — Optional: Change the Whisper Model

The default model is *base.en*. For faster results use *tiny.en*; for better accuracy on noisy audio use *small.en*:

```
WHISPER_MODEL=tiny.en python -m uvicorn src.app:app --port 8000
```

Model	Speed	Accuracy	Disk
tiny.en	Fastest	Lower	~75 MB
base.en	Fast	Good	~145 MB
small.en	Moderate	Better	~460 MB
medium.en	Slow	Best	~1.4 GB

Troubleshooting

- **ffmpeg not found** — ensure ffmpeg is on your system PATH and restart your terminal.
- **Invalid API key** — check that ANTHROPIC_API_KEY is set correctly in .env.
- **Port already in use** — kill the existing process or start on a different port.
- **Slow transcription** — switch to tiny.en for demos; use small.en for better accuracy.
- **Windows Execution Policy error** — run: Set-ExecutionPolicy RemoteSigned -Scope CurrentUser
