

SummarAI

User Manual

How to use SummarAI

NLP Group Project · 2025–2026

Overview

SummarAI is a meeting summarisation tool. You give it a recorded meeting — as an audio/video file or a plain-text transcript — and it returns three things:

- **Summary** — a concise paragraph capturing what the meeting was about.
- **Key takeaways** — the main points and decisions made.
- **Action items** — concrete tasks, with the responsible person where identifiable.

The language of the output is your choice, not the language of the meeting. You can attend an English meeting and receive everything in Spanish, or vice versa.

Getting Started

Option A — Hosted version (recommended)

Open the app link in any modern browser (Chrome, Firefox, Safari, Edge). No installation or account needed.

Option B — Run locally

Follow the Installation Guide to set up the project, then run:

```
python src/app.py
```

Open `http://127.0.0.1:7860` in your browser.

Uploading a Meeting

Drag and drop — or click Upload file — to load an audio, video, or transcript file. The supported formats are:

- Audio: .mp3, .wav, .m4a, .ogg, .flac
- Video: .mp4, .webm
- Text transcript: .txt, .md, .vtt, .srt

Once the file is loaded, click **Summarise**. A spinner with an elapsed timer will appear. Audio files take 1–8 minutes depending on length. Text files are nearly instant.

Reading the Output

Summary

One short paragraph — the meeting's purpose and overall outcome. Designed to be readable in under 10 seconds.

Key Takeaways

A list of bullet points, each tagged as either:

- **Decision** (purple) — something agreed, approved, or set as policy.
- **Note** (grey) — any other important point, fact, or concern.

Action Items

A checklist of concrete tasks. Each item shows the task description, the owner (if named in the meeting), and the deadline (if stated). You can check items off as they are completed.

Saving to a Project

Click **Save to project** after a meeting is summarised. Choose an existing project from the sidebar or create a new one. Saved meetings appear in the project timeline in the left sidebar, ordered by date.

You can delete individual saved meetings or entire projects from the sidebar. Deleting a project removes all meetings saved under it.

Known Limitations

- Owner attribution is reliable only when the speaker is named explicitly in the meeting.
- Non-English audio is not supported. The ASR model is English-only.
- Very long meetings (2+ hours) may take 5–8 minutes to process.
- The app requires an internet connection to reach the Claude API.
- iOS Safari does not support push notifications for PWA installs.
